## Connecting to eduroam from a Computer

Brad Christ - 2025-03-26 - [Comments \(0\)](#) - [Eduroam](#)

Eduroam is a federated network access service developed for research and education institutions around the globe to share internet access. When you travel to a university that is a member of eduroam, you can join the 'eduroam' wi-fi network and enjoy encrypted internet access for free.

### Member Institutions

USA : [https://www.eduroam.us/institutions\\_list](https://www.eduroam.us/institutions_list)

International : [http://monitor.eduroam.org/eduroam\\_map.php?type=all](http://monitor.eduroam.org/eduroam_map.php?type=all)

### Get ready to use eduroam

Follow the instructions below:

1. After completing the instructions, connect to the eduroam wireless network here on campus and go to <http://eduroamtest.sou.edu>.
  1. If you can't load the page, something is wrong.
  2. If the page loads, your computer is setup for eduroam and you can go back to your normal wireless network (SOU Wireless, SOU-Secure) to resume browsing the internet.

### Assisted Setup (Recommended)

Navigate to <https://cat.eduroam.org/?idp=662> on your computer and follow the instructions for connecting your Linux, Macintosh, or Windows device to eduroam.

#### Note

If you are running Linux, a Python script provided by eduroam will be used to set up your device. It is designed to run under Python 2 and Python 3. We recommend using the latest version of Python 3 available through your distro's package manager.
