How to Find Your Computer's Hostname

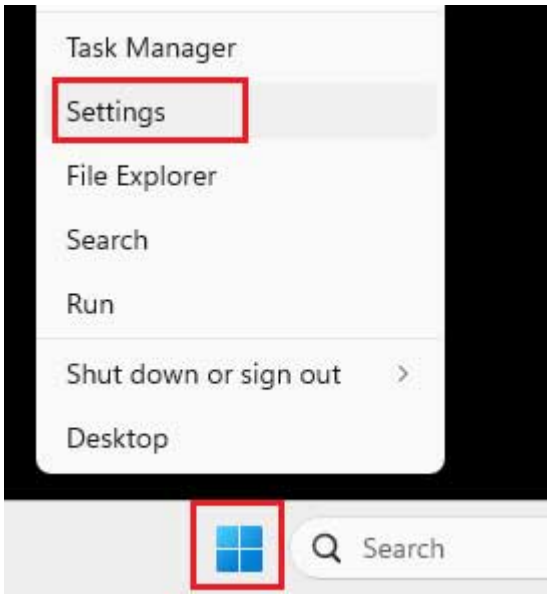

David Raco - 2025-05-29 - Comments (0) - Mac

This article will show you how to find your computer's hostname.

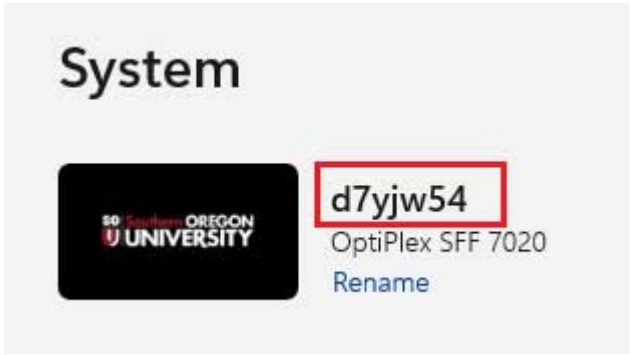

Windows

Method 1: Using Windows Settings

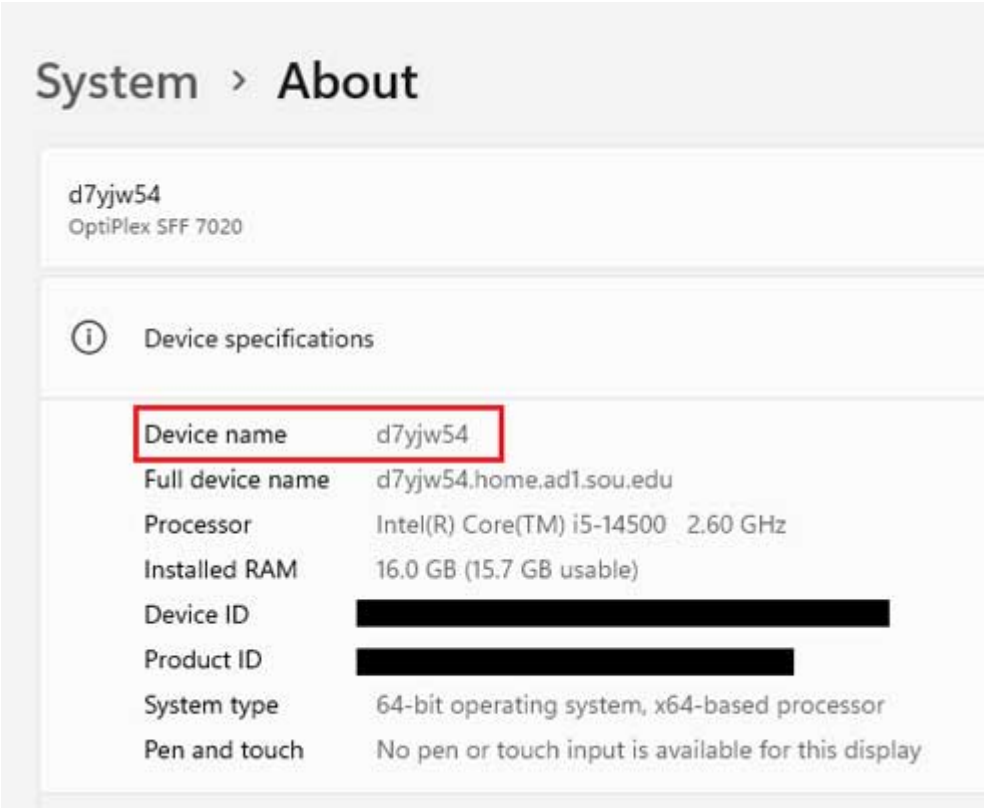

Open up Windows Settings by right clicking the **Start Menu** and from that menu clicking on the **settings** option.

You should be able to see the device name at the top left of the window brought up.

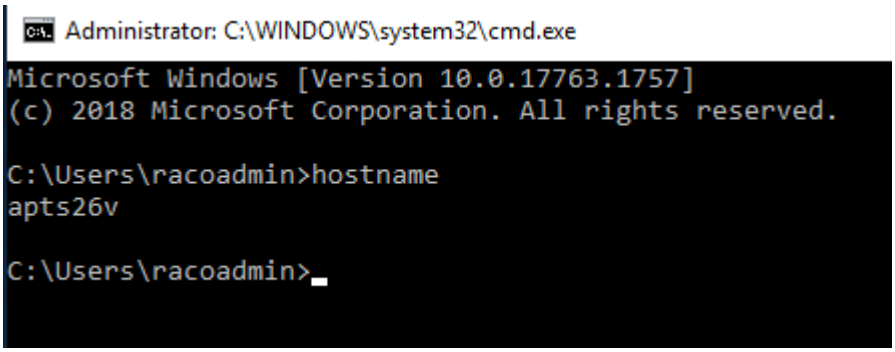

Yet, if you would like to be more thorough with your search you could find the **About** page located on the same menu usually towards the bottom of that page or you can search for it as well. Your computer's hostname is the "Device name" on the About screen. Please make a note of it.

Method 2: Using the Command Prompt

This method assumes that you are already familiar with using the command prompt on Windows. Use the other method if not.

Simply bring up a command prompt and execute the command "hostname."

Macintosh

Follow Apple's recommended instructions for locating your computer's hostname.
